One question. Five hidden steps.

A simple question triggers a multi-step retrieval chase and the answer often delays after the decision is made.

Result: The answer may arrive after the moment of decision has already passed.

The value is stored, not realised

The pattern holds worldwide, and the same gap is already measurable inside Bursa.

68%

of enterprise data is never used

Source: Seagate, Rethink Data

70%

goes unused for analytics

Source: Forrester

60%

say half their data is “dark”

Source: Splunk / IBM

THE SAME GAP, MEASURED INSIDE BURSA

20+

ad hoc data requests each month

40

staff-hours spent retrieving

< 2h

average turnaround per request

50%

involve data we already hold

RM 50k

annual productivity at stake

The gap: The data exists. The value does not. Half the effort is spent re-finding what Bursa already owns.

The questions are simple. The retrieval path is not.

Questions that surface in management meetings, market reviews and time-sensitive discussions.

TRADING ACTIVITY

Which investor group drove the recent decline in Average Daily Traded Value?

FUND FLOW

How does year-to-date fund flow compare with the same period last year?

MARKET DRIVERS

Which sectors or stocks are driving yesterday's market performance?

MARKET VELOCITY

How does month-to-date market velocity compare with last year?

IPO PERFORMANCE

How many companies listed on the Main, ACE and LEAP Markets this half?

ETF PERFORMANCE

Which ETFs recorded the highest growth in traded value and volume?

Today: Each of these can take several dashboards, manual comparisons and analyst validation before an answer exists.

Access alone was never going to be enough

The dashboards exist. The data exists. Four human habits still stand between a person and an answer.

01

Coordination fatigue

Every answer runs through somebody else. So the question quietly goes unasked.

02

Market literacy gap

A dashboard assumes a fluency in the market. Not everyone here had the same understanding.

03

Learning friction

Every dashboard has its own logic. Learning six is harder than asking one colleague.

04

Ownership avoidance

Pull the number yourself and you own the number. Most would rather not carry it.

The real barrier: It was never access to the data. It is the effort, and the accountability, of using it.

Paid Twice: Once by the Person, Once by the Decision

The accessibility gap costs an employee their independence and costs the organization its speed.

TODAY · DEPENDENCY

- ⚠ Every answer runs through somebody else
- ⚠ Waiting becomes normal, so questions go unasked
- ⚠ Specialists absorb work that is not their expertise

WITH BursaIQ · SELF-RELIANCE

- ✓ The person with the question reaches the answer
- ✓ Asking costs nothing, so more gets asked
- ✓ Specialists return to analysis and judgement

WHAT IT COSTS THE ORGANISATION

Slower decisions

Questions stay open during the discussion that needed them

Meeting disruption

Teams pause, defer or schedule follow-up work

Analytical bottlenecks

Specialists on repeat retrieval, not analysis

Inconsistent interpretation

Different filters produce conflicting answers

Reduced responsiveness

Slower reaction to market and stakeholder needs

Lower data return

Existing datasets deliver less than they could

Impact chain: Slower retrieval → Delayed insight → Deferred or less-informed decisions

THE PROPOSED SOLUTION

BursaIQ

Ask a Question. Get a Decision-ready Answer.

A secure natural-language intelligence layer that turns trusted internal data into accessible, visual and traceable insights.

ASK

Everyday language — no dashboards or jargon

ANALYZE

Interprets intent on governed data

ANSWER

Direct answer with context and source

ACT

Decide with confidence in the moment

Not a concept. This is running today.

A real question, a real follow-up, answered from governed data with the working and the source shown.

Conversational Market Intelligence

PROTOTYPE · GOVERNED DEMO DATA

Which investor group contributed most to the recent decline in ADV?

Intent parsed: `flow_contribution`

function selected: `fund_flow_contribution(metric="ADV_decline", period="Q2-2026")`

querying governed mart: `MKT_FUND_FLOW_DAILY · v1.8` (read-only)

calculation: governed · `fixed formula` · no free-form SQL

The Q2 ADV softening is driven primarily by **Foreign Institutions**, whose net participation fell by RM1.24 bil vs the prior quarter — roughly 76% of the total decline. Local Institutions trimmed RM310 mil, while **Local Retail** actually added RM420 mil, partially cushioning the fall. This is a rotation story, not a broad-based withdrawal.

Request Human-in-loop Verification

Answered in 3.6s · Governed

Related: YTD fund flow vs last year What is fund flow?

How does year-to-date fund flow compare with the same period last year?

Intent parsed: `flow_ytd`

function selected: `fund_flow_compare(period="YTD", benchmark="prior_year")`

querying governed mart: `MKT_FUND_FLOW_DAILY · v1.8` (read-only)

calculation: governed · `fixed formula` · no free-form SQL

YTD 2026 net foreign flow stands at **-RM10 mil** versus **RM4,295 mil** for the same period last year — a swing of **-RM4,305 mil**. 2026 began strongly (Jan, Apr inflows) but May–Jun outflows turned the cumulative position negative. Last year showed steadier, consistently positive months.

PROVENANCE — WHY YOU CAN TRUST THIS

Source: `MKT_FUND_FLOW_DAILY · v1.8`

Period: Jan – Jun 2026 vs Jan – Jun 2025

Calculation: Monthly net foreign flow, Jan–Jun, current vs prior year

01 Asked in plain language

No SQL, no dashboard, no need to know where the data lives.

02 Governed function call

A fixed formula against a read-only mart, versioned. No free-form SQL is ever written.

03 A real follow-up

The second question builds on the first. This is a conversation, not a search box.

04 Verifiable, and checkable

Provenance on every answer, plus one-click human verification for high-stakes questions.

Working prototype · Governed demo data · Answered in 3.6s with numbers and chart

Where we are: Built before the pitch, not promised after it. What you are seeing is the actual product, not a mockup.

One Engine, Bursa IQ Engine, One Governed Path to Data

Every surface calls the same orchestration engine: The model reasons, the governed layer supplies the numbers.

Every answer ships with: Direct answer · Chart · Reporting period · Source dataset · Calculation used

From Accuracy to Accountability

A conversational layer is only worth having if the number it returns can be trusted in a board paper.

01

Governed calculation

The formula lives in the semantic layer. The model selects a function, it never writes free-form SQL, so the maths cannot drift.

02

Golden-answer testing

Every metric has a known-correct result. Generated answers are compared against it before anything ships.

03

Regression testing

Historical questions are re-run before any prompt or model change, so accuracy drift is caught before users meet it.

04

Human validation on request

For board-level questions, one click routes the answer to the data owner to confirm before it is used.

WHAT WE ARE NOT CLAIMING

Generative systems can be confidently wrong, and this one is no exception. That is precisely why the calculation is governed rather than generated, why every answer carries its source, and why a person can be put back in the loop on demand.

Standard: The model may phrase the answer. It never decides the number.

Everyone can ask. Not everyone can see.

BursIQ widens who can ask a question. It never widens what a person is allowed to see.

01

User ask

One entry point for the whole organisation. No one needs to know where the data lives.

02

We check who are them

Entra ID resolves your identity, role and business unit before anything is retrieved.

03

Query inherits user's rights

Row and column entitlements are applied at query time, not filtered out afterwards.

04

User see only their scope

The answer is built from data that the role already permits. Nothing else is reachable.

WHAT THAT MEANS IN PRACTICE

A market analyst asks about ADV

Answered in full

The same analyst asks about payroll

No data returned

An HR partner asks about benefits take-up

Answered, for their population only

Distinction: BursIQ inherits user existing access. It is a faster way to reach what users are already entitled to, never a way around it.

Market data is where we start, not where it stops

The same governed engine can serve any approved domain, so value reaches every function rather than a single desk.

MARKET & TRADING

Market Intelligence

ADV, velocity, fund flow, IPO pipeline, ETF performance

IN SCOPE

LISTING & ISSUER

Issuer Insight

Listing pipeline, filings status, issuer profiles and disclosures

IN SCOPE

STRATEGY & COMMS

Planning & Narrative

Peer benchmarks, market share and the numbers behind stakeholder communications

FINANCE & CORPORATE

Cost & Performance

Budgets, cost centres and spend against plan

RISK & COMPLIANCE

Oversight & Surveillance

Trend monitoring, unusual-activity context and case background

HUMAN RESOURCES

People & Workforce

Identity and org structure, applicant tracking, benefits administration

The principle: One way to ask. Many governed domains behind it. Every department served by the same engine.

Works if only the data owners are in the room

BursalQ is not one team's project. Every governed domain has an owner, and each of them makes the layer possible.

THE CORE

Group Technology & Data and Digital Services

Owns the databases, the pipelines and the platform every answer depends on. Without their data marts and access model there is no governed layer to ask questions of.

Market Operations

Defines and validates the market metrics

Human Resources

Sets the scope and entitlements for people data

Finance

Confirms figures and definitions carry across reporting

Risk & Compliance

Sets the guardrails and reviews what may be asked

Security & Identity

Owns the Entra ID roles the access model runs on

Data Governance

Approves every definition before it enters the layer

What we are asking for: Not budget, and not headcount. Access to the data you already own, and a definition we can all agree on.

BursalQ vs other Tools: Key Differentiators

Delivering Up-to-date Exchange Intelligence for Faster and Smarter Decisions

	Traditional AI Chatbots	Business Intelligence Tools	BursalQ
Data Retrieval	✗ Static knowledge	⚠ Requires manual refresh	✓ Queries up-to-date data
Self-Query Agents	✗ Manual inputs required	✗ Predefined dashboards	✓ Metadata search and context retrieval
NLP	✓ General responses	✗ Requires SQL or UI navigation	✓ Context-aware, Bursa-specific NLP
Security & Access	⚠ Limited access control	✓ Enterprise-grade RBAC	✓ Fine-grained, role-based security
Bursa-Specific Tuning	✗ Generic AI responses	⚠ Requires configuration	✓ Deep understanding of Bursa terms
Seamless Teams Integration	✗ Requires custom setup	✗ Not natively integrated	✓ Fully embedded in Teams workflow

BursalQ combines the simplicity of AI chat, analytical power of BI platforms and enterprise-grade security at scale

What it costs, what it returns, and when it pays back

Validated internal baselines on one side, a contained build on the other.

THE RETURN · PER YEAR

3h → 15m

average answer time

70%

of ad hoc requests automated

40 hrs

analyst time redirected / month

RM 50k

annual productivity value

THE INVESTMENT · TO PILOT

~12 weeks

proof of concept to pilot

3 people

part-time, no new headcount

Existing

Azure estate and licences

4 marts

read-only, already built

WHERE THE VALUE LANDS

Productivity

Cut retrieval and formatting effort · Fewer repetitive ad hoc requests · Redirect analysts to higher-value work

Decision-making

Answer questions during meetings · Reduce follow-up delays · Improve consistency and confidence

Capability

Broaden self-service access · Raise data and market literacy · Scale conversational analytics

Payback: The pilot pays for itself inside the first year on redirected analyst time alone, before any decision-quality gain is counted.

A large upside, with every risk named and controlled

What BursaIQ unlocks if it works, and what stands in the way if it is built carelessly.

THE OPPORTUNITY

ANTICIPATE

Insight arrives before the question is asked

ADVISE

Understanding at every level and in every language

AUTOMATE

Answers become finished, formatted work

AMPLIFY

One answer lifts the whole organisation

PRINCIPAL RISKS · AND THE CONTROL

Production and data-security exposure

✓ Read-only. Isolated from live trading systems.

HIGH

Inaccurate or misleading AI answers

✓ Governed functions only. The model never writes the formula.

HIGH

Data governance and access complexity

✓ Role-based access and entitlement checks at query time.

MED

Low adoption or limited relevance

✓ Designed around the four adoption barriers, not around the data.

HIGH

Key gate: No production connectivity and no autonomous decisions until the security, accuracy and governance gates are passed.

Scale only when Evidence supports the next stage

A phased approach limits exposure, produces measurable learning and keeps management in control of each expansion.

What we are asking for: Approval to run Stage 01, one team, one read-only mart, and a named data owner per domain

THE NEXT HORIZON

Intelligent Exchange

From Answering to Anticipating.
